

Dossier Space Pilot — Session 12 Test Plan

Sequence Tracking: LJM/Raptor Valuations

Planned Session ID	DS-202608xx-S12
Operator	Ken Tombs
Leader / Design Lead	Claude
External Assurance	Leonard / ChatGPT
Status	DRAFT — FOR REVIEW BEFORE SESSION OPENS

1. Purpose

Session 12 will test Dossier Space against a realistic legal-style evidential analysis rather than a primarily infrastructural or smoke-test task.

The session will examine whether the governed workflow can reconstruct a documentary sequence from a large email corpus while maintaining:

- evidential traceability;
- custody integrity;
- distinction between evidence and inference;
- explicit treatment of uncertainty and missing records;
- reproducibility of the analysis;
- human oversight throughout.

A secondary purpose is to generate a clear and credible worked example for the forthcoming SCL paper.

2. Investigation Question

A successful result does not mean finding something incriminating. Success means producing a bounded, traceable and properly qualified evidential account.

Reconstruct the documentary sequence surrounding Vince Kaminski’s concerns or analysis relating to LJM/Raptor valuations. Identify the participants, chronology, information exchanged, responses or subsequent actions, references to discussions occurring outside email, and any material gaps or uncertainties in the available record.

The question is deliberately neutral. The objective is not to establish fraud, misconduct, liability or intent. The task is to determine what the available documentary record supports, what it suggests, and what it does not establish.

3. Scope

The investigation should begin narrowly and expand only where supported by the evidence.

Initial concepts are expected to include:

- Vince Kaminski;
- LJM;
- Raptor;
- valuation / valuations;
- related transactions or structures revealed by retrieved material;
- named participants emerging from the evidence.

No assumption should be made at the outset about which individuals, documents or communications are material. The search should be driven by the evidence discovered during the session rather than by a pre-written historical narrative.

4. Method

The session will use the established CIPDA + ROMER governed workflow.

Context

Establish:

- corpus and custody-server state;
- session identifier;
- applicable repository/version;
- known dataset limitations;
- investigation boundaries;
- prior knowledge or external material deliberately excluded from the investigative phase.

Intent

Determine what can responsibly be established about:

- the chronological development of the issue;
- who participated;
- what information was communicated;
- whether concerns, assessments or positions changed;
- what responses or subsequent actions are evidenced;
- whether communications refer to telephone calls, meetings or other undocumented exchanges;
- where documentary gaps remain.

Plan

The Leader should propose search actions sequentially.

Deliver

Construct an evidential sequence containing, where supported:

- date/time;
- sender;
- recipients;
- subject;
- relevant content or proposition;
- relationship to preceding/following records;

- evidential significance;
- source/result reference.

Assure

Challenge the resulting account for:

- missing records;
- alternative interpretations;
- unsupported causal assumptions;
- chronology errors;
- incomplete recipient coverage;
- references to communications outside the corpus;
- conclusions stronger than the underlying evidence permits.

Each substantive action should state, as appropriate: purpose → search/action → result → interpretation → next step.

Searches should progress from narrow identification toward contextual and corroborative analysis.

5. Expected Investigation Stages

Stage 1 — Seed discovery

Locate high-confidence messages linking Kaminski with LJM, Raptor and/or valuation issues. Preserve the raw result set.

Stage 2 — Sequence construction

Identify preceding and subsequent messages sufficient to reconstruct the immediate documentary sequence. Do not assume that conventional email threading captures the entire sequence.

Stage 3 — Participant expansion

Identify people entering the sequence and determine whether their related communications materially affect the account.

Stage 4 — Topic expansion

Use language appearing in the discovered records to identify related terminology, projects, transactions or structures. Any expansion should be documented rather than silently introduced.

Stage 5 — Corroboration

Search for independent or related records that support the emerging chronology, contradict it, clarify actions taken, demonstrate distribution of knowledge, or reveal relevant earlier or later communications.

Stage 6 — Off-record indicators

Identify references such as telephone calls, meetings, conversations, discussions, instructions communicated orally, and attachments or documents unavailable in the corpus. These should be treated as documentary gaps or leads, not reconstructed as events unless independently supported.

Stage 7 — Evidential account

Produce a concise sequence explaining: what the documents show → what can reasonably be inferred → what remains unknown.

6. Evidential Discipline

The session should explicitly distinguish between:

Documented fact — directly evidenced by a retrieved record.

Supported inference — a conclusion reasonably drawn from one or more records but not expressly stated.

Unresolved proposition — plausible but insufficiently evidenced.

Documentary gap — an indicated communication, document or event that cannot presently be located or examined.

Absence of an email should not automatically be treated as evidence that an event did not occur.

7. Human-in-the-Loop Control

The established operating model remains unchanged. Claude acts as Leader and proposes investigative actions.

Ken remains the human operator and:

- executes or authorises relevant actions;
- observes outputs;
- may challenge or stop a proposed step;
- records material interventions.

The Leader should not silently broaden the investigation or alter the evidential question.

8. Custody and Reconstructibility

Session 12 should use the custody and logging controls validated in earlier sessions. Where applicable:

- search parameters are recorded;
- result sets are preserved;
- hashes are retained;
- result paths are recorded;
- relevant candidate records are identifiable;
- material search refinements are logged;
- failures/timeouts/interventions are recorded.

A third party should be able to reconstruct how the final sequence was produced.

9. External Historical Validation

External sources concerning Enron, Kaminski, LJM or Raptor should not be used to guide the principal investigation.

After the Dossier Space analysis is complete and frozen, the resulting account may be compared against independently available historical, regulatory or court material.

This provides a useful secondary validation:

What did the governed analysis discover from the corpus itself, before it was told the accepted historical narrative?

Any external comparison should therefore be clearly separated from the primary corpus analysis.

10. Session Deliverables

- session ledger / work log;
- retained search-result artefacts;
- candidate/document register where appropriate;
- reconstructed chronology;
- participant map/list;
- material documentary gaps;
- findings with fact/inference/uncertainty distinctions;
- ROMER record;
- assurance assessment / scorecard;
- session narrative suitable for later pilot reporting.

11. Success Criteria

1. a defensible documentary sequence can be constructed, or the evidence establishes why one cannot be constructed;
2. each material proposition can be traced back to evidence;
3. search expansion is explicit and reproducible;
4. significant documentary gaps are identified rather than concealed;
5. fact and inference remain distinguishable;
6. no conclusion exceeds the evidential support available;
7. the analysis can be reconstructed from the retained artefacts and ledger;
8. the workflow produces something recognisable as useful legal evidential analysis rather than merely a set of search results.

12. SCL Worked-Example Test

For publication purposes, the session should be assessed for whether it can ultimately be reduced to a simple explanatory form:

Initial question → first evidence → expanded sequence → corroboration/challenge → documentary gap → assured conclusion.

This should provide the SCL reader with a practical illustration of what Dossier Space adds beyond conventional keyword search.
