

Dossier Space Workstation Edition

Foundation Implementation Plan

Date: 13 July 2026

Purpose

This document sets out a practical, staged plan for building a sovereign AI workstation suitable for Dossier Space experimentation. The emphasis is on establishing a reliable foundation before adding advanced capabilities.

Stage 1 – Build the Workshop

Prepare the workstation.

- Update Windows 11
- Install latest graphics drivers
- Install Python
- Install Visual Studio Code
- Install Git

Goal: A stable workstation ready for development.

Stage 2 – Give it a Brain

Install Ollama.

Download an appropriate Qwen model.

Verify the model responds correctly to a simple prompt.

Stage 3 – Give it a Face

Install Open WebUI.

Confirm you can interact with the local model through a browser interface.

Create your first project.

Stage 4 – Build Your Library

Create a simple folder structure:

- Evidence
- Cases
- Primers
- ROMER
- Reports
- Scripts
- Models
- Archive

Stage 5 – Teach it to Read

Introduce local document indexing and retrieval (RAG) once the basic system is working. Initially concentrate on analysing individual documents reliably.

Stage 6 – Record Everything

Implement ROMER logging.

Capture:

- Timestamp
- Model
- Primer used
- Documents analysed
- Result
- Confidence
- Final report

Stage 7 – Introduce Primers

Use structured primers to guide analysis rather than relying on ad hoc prompts.

Adopt the flow:

Question → Primer → AI → ROMER → Report

Stage 8 – Python Helpers

Develop small utilities for:

- Importing emails
- PDF conversion
- File renaming
- Metadata extraction
- Evidence hashing
- Report generation
- Duplicate detection

Stage 9 – Complete One Case

Run a complete end-to-end test using a small dataset (for example, ten emails, one PDF and one witness statement).

Verify the full workflow before attempting larger collections.

Stage 10 – Grow Slowly

Only after the foundation is stable, expand to:

- Additional models
- Vector databases
- Multi-agent workflows
- Multi-user operation
- Secure appliance deployment

Overall Roadmap

Foundation

↓

Single AI

↓

Document Analysis

↓

ROMER Logging

↓

Primers

↓

One Complete Case

↓

Enron Dataset

↓

Multi-user

↓

Secure Evidence Appliance

Guiding Principle

The objective is not simply to run a local LLM. It is to build a professional evidence workstation where the AI operates within a controlled evidential environment and remains under the user's governance.
