

Session Planner — v1.1

3 August 2026 · Ken Tombs with Claude · Supersedes v1.0. Changes in v1.1: Sessions 6 and 7 moved to completed; the 17-day hiatus recorded as an experimental condition; the MASTER REFERENCE DOCUMENT added as a standing deliverable to protect the learning. Standing plan: amendable per session; every amendment produces a new version, forward-only.

1. Where the pilot stands

The comparison design is closed (Sessions 1–5): retrieval verified 9/9 across primed/4.6, baseline/5, and primed/5 — capability constant, exhibit discipline tracking the primer, governance overhead measured. The boundaries are hardened (Session 6): procedures drafted, the subject frozen. And the architecture has now survived a genuine 17-day hiatus (Session 7): the founding doctrine — document is custody, not memory — demonstrated rather than asserted, with the freeze's exact boundary mapped. Eighty-nine log entries; the document set approaches twenty artefacts. What remains: the mediation layer (Sessions 7–9), the primer apparatus (Session 10), the writing turn (Session 11), and the Master Reference throughout.

2. Sessions completed

#	Date	What happened	Deliverables
1–5	13–14 Jul	Comparison design established and closed: retrieval verified 9/9 under three conditions (primed/4.6, baseline/5, primed/5); capability constant; the primer's contribution isolated as exhibit discipline. Governance findings: silent continuity, unrequested memory, audit-team contamination, invisible primer, mid-session auto-updates. Entries 001–070.	5 session logs; ADR-003; Synthesis; break-even note; exhibits
6	15 Jul	Boundaries session (bench-only): four procedures drafted, two executed; Session 5 harvested; hidden .git solved (instrument broken by the rename it might have recorded); destroyed report recovered from checkpoints; subject frozen — volatility root-caused to "autoUpdatesChannel: latest". Entries 071–081.	Session 6 log; 4 procedures; Glossary; Planner v1.0; exhibits
7	3 Aug	Restart after a 17-day hiatus — the founding doctrine (document is custody, not memory) DEMONSTRATED: verified state rebuilt from records alone; four phantom anomalies dissolved; one real drift caught (model default moved server-side to Opus 4.8 under the freeze) and corrected; freeze boundary mapped (client+filesystem held, roster did not). Entries 082–089. [ADR-004 design to follow in-session.]	Session 7 opening note & recap; The Reconnection (worked example); ADR-004 (in progress)

3. Sessions planned, and the standing capstone

#	Title	Scope	Deliverable	Credit
7 (cont.)	ADR-004: the bench on paper	MCP custody server designed before any code: tool set frozen (read_file, list_folder, search_messages, get_headers, hash_document, verify_hash); self-describing	ADR-004 + tool spec; scorecard draft	Minimal (design lead Opus 4.8)

#	Title	Scope	Deliverable	Credit
		definitions; scoping and privilege-gate rules; chained custody-log schema. Side-deliverable: the Session 10 scorecard rubric, fixed before the runs it will score.		
8	Build & smoke-test	Dossier Space MCP Server v1 implemented in Python to the frozen spec; Claude Code connected in passthrough (Phase 2a, custody off); one test task through the pipe. Design-lead escalation to Fable 5 available if the code strains.	Working server; first mediated run	Moderate
9	Measured Phase 2 runs	Survey and retrieval through 2a (passthrough) and 2b (custody on), scored against existing ground truth and the Phase 1 grid. ADR-003's central number measured: the cost of governance, isolated. Trace-versus-log gap runs for the first time.	Completed experimental grid, all phases	The credit session
10	The primer apparatus (dimensions & scorecard)	Multiple primers in concert: a CIPDA-Intake stage primer deployed alongside standing v0.1 (the §4.2 layering exercised for the first time); axioms as a distinct stratum; the scorecard applied — exhibit discipline scored per run against the pre-fixed rubric. Design lead escalates to Fable 5.	Scored primer-layering runs; rubric v1 results	Moderate (Fable 5)
11	Synthesis v2 & the turn to writing	Grid and Synthesis updated across all phases and primer conditions; deleted_items sampled if budget allows; open items closed or carried; SCL skeleton opened.	Synthesis v2; SCL skeleton	Cheap
MR	MASTER REFERENCE DOCUMENT	The definitive, most-detailed encapsulation of everything the pilot learned — architecture, findings, procedures, doctrine, metrics, the experimental grid, the governance economics, and the vision. COMPILED FROM THE FILED RECORD (the session logs and deliverables), section by section, validated against source — not from conversational memory. Built as a modular capstone (may span its own dedicated pass or a fresh conversation with full context budget). Findings are tagged "→ reference" as they arise so nothing is hunted for at the end.	Master Reference Document v1.0	Dedicated pass

4. Why the Master Reference is a standing deliverable, not a final task

The learning accumulating in this pilot is significant and must be protected — which means it cannot wait to be compiled at the very end from fading memory. The Master Reference is therefore treated as a **STANDING** deliverable: findings are tagged for it as they arise, and it is compiled from the filed record (the session logs and deliverables), section by section, each section validated against its source entry — never from conversational recollection. This is the pilot's own doctrine applied to its own capstone: the documents are custody; the reference is built from them, not from what anyone remembers. It may be assembled in a dedicated pass, or in a fresh working context with full budget for synthesis — losing nothing, because nothing of value lives only in a conversation. The Master Reference is where the pilot becomes reusable by others: the definitive account a collaborator, an assurer, or the profession can pick up and act on.

5. The logic of the ordering

Reversible work precedes irreversible: design (7) before build (8) before measurement (9); nothing is built on an unfrozen spec. Credit is spent where it buys the paper's missing number — the cost of governance, isolated (9). Method follows infrastructure: Session 10 measures the primer apparatus against Session 9's independent logs. The writing turn (11) banks it. And the Master Reference runs ALONGSIDE all of it, accumulating, so the encapsulation is never a race against memory. Standing caveats confirmed by Session 7: the subject cannot be fully frozen (the vendor's roster drifts server-side) — so the model in use is a mandatory banner-read every session; and custody traps recur when discipline goes cold, so the procedures are run in full every time, not internalised and set aside.

6. Standing doctrine (pointer)

The working rules — session/run/entry clocks, wake-up ritual, two-window discipline, verification outside the subject, per-command approvals, archive-then-delete-then-verify, per-run filenames, filed-means-frozen, identity verified at birth, corrections forward-only, and now: three-part mandatory banner-read, Start-menu bench launch, verify-anomaly-before-recording-cause, and workstation lock-down at setup — are consolidated in the Pilot Synthesis §3 and the Glossary, and will be gathered definitively in the Master Reference. This planner tracks WHERE the pilot is going; the Synthesis and Glossary record HOW it travels; the Master Reference will hold EVERYTHING.
