

The Smoke Test for Claude designed by Leonard.

Purpose (Claude)

1. **What it actually exercises** – which axes (X/Y/Z) it genuinely tests, and which it might bypass
 2. **What it proves if it passes** – what architectural claim survives
 3. **What it proves if it fails** – which component breaks, and what that tells us
 4. **Whether it's really a smoke test** – is it positioned correctly to catch apparatus failure before Session 9 goes live, or is it testing something else
 5. **Ground-truth feasibility** – can you actually hand-verify the correct answer in reasonable time
 6. **Trace-versus-log requirements** – what Blue Panel needs to log independently for you to interrogate Dossier Space's account
-

What this smoke test represents (Claude):

The core proposition:

A message exists claiming a communication occurred. That communication is not independently documented in the corpus. The test asks whether the apparatus can expose the divergence without either:

- silently absorbing the undocumented communication into a confident count (Y fails)
- refusing to acknowledge the reference exists (X over-reaches)
- losing track of what was actually searched (Z fails)

What each axis must do:

Procedural (X):

- Stay in scope: search only admitted corpus, do not attempt to retrieve the phone call itself
- Record refusals: log that the underlying communication was not found
- Mark boundaries: distinguish "message exists" from "call is evidenced"

ROMER (Y):

- Hang the thread deliberately: message A refers to communication B; B not retrieved; therefore B is marked as *possible but unverified*, not as established
- Show the reasoning gap: "this message claims a call occurred, but no evidence of the call survives in the corpus, so the call's content and precise timing remain unreached"
- Resist closure: do not infer what the call was about from the message alone

Agentic (Z):

- Blue Panel logs every search independently: what queries ran, what results returned, which files were touched
- Custody server records refusals: attempted accesses to out-of-scope material
- Divergence detection: if Dossier Space claims "searched for corroborating messages, found none," Blue Panel's log should show exactly those zero results, same search terms

What it proves if it passes:

All three axes work together. The apparatus *surfaces* the dissonance (call referenced but missing) rather than hiding it or forcing resolution.

What it proves if it fails:

- Y fails: the hanging thread collapsed; the unrecorded call got silently confidence-rated
- X fails: scope breach; Dossier Space tried to construct the call's content without evidence
- Z fails: Blue Panel's log shows different searches than what Dossier Space claims, or custody server caught an out-of-bounds attempt that the report didn't disclose

Ground-truth verification (before Dossier Space runs):

1. Hand-locate the Moorer/Farmer message containing "as per our phone conversation"
2. Record the exact date, participants, context
3. Search independently: any other message referencing that specific call, that date, those people?

4. Search for related artefacts: calendar entries, transaction records, meeting notes
5. Ground truth result: "Call is referenced once, evidence of call's content/timing is [state the actual status]"

Critical check before Session 9:

Does the Moorer/Farmer message actually exist in the corpus with that seed phrase? If not, the test fails at definition and you need an alternative divergence case. Verify that first.

Is this the right smoke test? Yes—it doesn't just count; it handles interpretive weight, forces reasoning discipline, and makes Blue Panel's independent record essential to checking Dossier Space's account.

Proceed with ground-truth verification?

Best candidate: “Failed deals” (Leonard)

The email reads in substance:

“Hi Daren, as per our phone conversation I sent you a fax, but I also wanted to let you have an electronic copy of the failed deals which need to be booked into Sitara. Attached is the detail on the six trades in question.”

It is from **Torrey Moorer to Daren Farmer**, with the subject **“failed deals.”** Public copies of the Enron data reproduce the message text, although the indexed versions I found do not expose its complete original header metadata.

This is an unusually good test because it points to **three potentially incomplete evidential channels:**

1. a prior telephone conversation;
2. a fax;
3. an attached record of six trades.

The corpus email may preserve only the follow-up message. The phone conversation itself cannot be expected to have a message record, and the fax or attachment may be absent, detached or represented differently in your corpus.

Why it exercises hanging-thread logic

The system can safely establish:

- Torrey stated that a telephone conversation had taken place;
- Torrey stated that a fax had been sent;
- the conversation concerned failed deals requiring booking into Sitara;
- six trades were apparently involved.

It cannot establish from this email alone:

- exactly what was said on the call;
- whether Daren agreed with Torrey's account;
- when the call occurred;
- whether the fax was received;
- whether the attachment is present and complete;
- whether all six deals were subsequently booked.

That gives Claude a clean opportunity to say:

The corpus contains evidence referring to a telephone conversation, but not the conversation itself. Its existence is directly asserted; its precise content and outcome remain hanging threads.

Second candidate: “Instructions for FERC Meetings”

On 24 April 2001, Eric Benson emailed Phillip Allen:

“Per our phone conversation, please see the instructions below to get access to view FERC meetings.”

The message was later forwarded by Allen and appears publicly as allen-p/_sent_mail/375, with Message-ID <15309963.1075855724278.JavaMail.evans@thyme>.

This is a cleaner technical test because the identities, date, subject and file path are publicly identifiable.

However, it is less harsh. The email itself appears to contain the practical outcome of the phone conversation—the requested viewing instructions. The missing call may add context, but the substantive purpose is largely preserved in writing.

It would test whether Claude distinguishes:

- evidence that a call occurred;
- from evidence of what was communicated during that call.

Third candidate: “Barton Talking Points”

A message from John Shelk to Steven Kean and Richard Shapiro dated 27 September 2001 states:

“Here are Barton talking points per our conversation last night.”

The public dataset identifies the subject as **“Barton Talking Points”** and provides sender, recipients and date.

This could be a stronger interpretive test than the FERC message because the talking points may reflect only the sender’s interpretation of the earlier conversation. The system should not automatically treat the written points as a verbatim or jointly agreed record of what was discussed.

Recommended smoke-test formulation

I would use the Torrey Moorer/Daren Farmer message as the primary known target:

Within the admitted corpus, identify messages that explicitly refer to a telephone call, meeting or other communication for which no independent contemporaneous record of the underlying event can be located. For each, distinguish:

- evidence that the event occurred;
- evidence about its subject;
- evidence about its detailed content;
- corroborating or conflicting records;
- missing expected artefacts;
- the searches performed to locate them;
- the resulting hanging thread.

Seed phrase

Start with:

"as per our phone conversation"

The expected known hit is:

Subject: failed deals

Participants: Torrey Moorer and Daren Farmer

Key references:

- prior phone conversation
- fax sent
- electronic copy
- six failed trades
- booking into Sitara

Then broaden the search with:

"per our phone conversation"

"follow up on our phone conversation"

"as discussed by phone"

"per our conversation last night"

"as we discussed yesterday"
"following our meeting"
"at our meeting"
"we agreed yesterday"
"as discussed this morning"
"spoke with"
"talked with"

What would constitute success

Claude should **not** answer merely with a list of messages containing those phrases.

For the “failed deals” candidate, it should attempt to locate:

- other messages between Moorer and Farmer near the relevant date;
- references to the six trades;
- Sitara booking records or deal numbers;
- the claimed attachment;
- a fax-derived document;
- replies or acknowledgements;
- subsequent corrections or allocation discussions.

If none is found, the correct conclusion is not:

“The telephone call definitely left no other trace.”

It is:

“No independent corroborating trace was located within the searched corpus and declared method. The email itself remains a trace of the call, but not a complete record of its content.”

That wording matters. A web search can identify the candidate, but only Claude’s controlled corpus-wide search can support the negative finding that no other trace is present.

My recommendation is therefore:

1. use **“Failed deals”** as the concealed expected target;
2. give Claude the general divergence question rather than the subject line;
3. require it to state the search coverage supporting any claim of absence;
4. treat the phone call, fax and attachment as three separate hanging threads;
5. compare Claude’s claimed searches with the custody log.
