

Dossier Space Pilot — Governance Ledger & Session Deliverables Audit Report

Report Date: 2026-08-24

Auditor: Claude (Design Lead)

Pilot Operator: Ken Tombs

Pilot Status: Active (Session 13 pending)

Publication Target: Society for Computers and Law (SCL)

Executive Summary

This report documents the state of the Dossier Space Pilot governance infrastructure as of 2026-08-24. The audit reveals a **critical ledger integrity gap**: 19 session start events are recorded, but only 3 session close events exist, indicating incomplete audit trail logging. Despite this, the investigation findings and deliverables remain intact and recoverable from the Session GIT Deliverables repository. The ledger issue requires architectural resolution before Session 13 proceeds.

1. Governance Ledger State

1.1 Ledger File Metadata

Location: `E:\AAll XPlain\Dossier Space Pilot\Governance Ledger\session-ledger.jsonl`

Format: JSON Lines (JSONL), append-only

File Size: 209,786 bytes

Total Entries: 28

Last Write: 2026-08-17 16:10 UTC (file timestamp)

1.2 Entry Type Distribution

Entry Type	Count	Status	Notes
<code>session_start</code>	19	Active	Threshold event; marks session initialization
<code>session_close</code>	3	Critical Gap	Only 3 of 19 starts have closes recorded
<code>mcp_call</code>	3	Sparse	Tool invocation events (significantly underrepresents actual tool use)
<code>exception</code>	1	Informational	Path-not-found error during Session S09.5
<code>documentary_gap</code>	1	Schema Variant	Governance tool working; end-to-end path verified
<code>tool_call</code>	1	Schema Variant	Legacy or schema variant entry type
<code>memory_compression</code>	0	Zero Records	No formal memory compression events logged across entire pilot

Total accounted: 28 entries ✓

1.3 Session Chronology

Session DS-20260806-S09.5

Starts: 3 recorded

Closes: 0 recorded

Entry Types: `session_start` (3), `exception` (1)

Status: Open (no close event)

Description: MCP Custody Server v1.2 defect repairs (smoke test)

Notes: First session in pilot; foundational MCP infrastructure work

Session DS-20260806-S10

Starts: 2 recorded

Closes: 0 recorded

Entry Types: `session_start` (2)

Status: Open (no close event)

Notes: Follow-up to S09.5 repairs

Session DS-20260811-S11-v1.4

Starts: 7 recorded

Closes: 0 recorded

Entry Types: `session_start` (7)

Status: Open (no close event)

Description: MCP Custody Server upgrade to v1.4.3 (designated v1.4 in ledger)

Notes: Extended session; foundational MCP infrastructure stabilization

Session DS-202608xx-S12 (Undated)

Starts: 7 recorded
Closes: 3 recorded
Entry Types: `session_start` (7), `session_close` (3), `mcp_call` (3), `documentary_gap` (1), `tool_call` (1)
Status: **Partially Closed** (3 closes vs. 7 starts)
Description: MCP Custody Server repair work; governance ledger integrity diagnosis
Notes: Investigation into Vince Kaminski / LJM-Raptor thread; Findings F-001 through F-016 produced

2. Ledger Integrity Issues

2.1 Session-Close Gap (Critical)

Finding: 16 sessions lack recorded close events.

Session Starts Closes Gap

S09.5	3	0	3
S10	2	0	2
S11-v1.4	7	0	7
S12	7	3	4
Total	19	3	16

Root Cause: Session close events are not being consistently written to the ledger. This breaks the symmetry expected for session lifecycle auditing.

Impact on Governance:

Session entry/exit timeline cannot be reconstructed from ledger alone

Audit trail for Sessions S09.5, S10, and S11-v1.4 is incomplete

Session S12 partially recoverable (3 of 7 closes logged)

Mitigation Strategy (Implemented):

Findings files (F-001 through F-016) stand as the working system of record for investigation outputs

Session GIT Deliverables repository (118 artifacts) provides source-of-truth for all filed work

Ledger serves as partial audit trail; gaps are acknowledged rather than fabricated

2.2 Memory Compression Events (Zero Records)

Finding: No `memory_compression` entries exist in the ledger, despite active pilot spanning 4 distinct sessions.

Inference: Memory compressions either:

Were not formally logged as ledger events, or

Were not triggered during pilot operations

Impact: Cannot audit AI context window management decisions from ledger alone. Context loss events are not timestamped.

2.3 Tool Call Underrepresentation

Finding: Only 3 `mcp_call` entries recorded, yet Findings F-001 through F-016 represent dozens of actual tool invocations (keyword searches, message reads, file operations via MCP Custody Server).

Root Cause: The ledger's `tool_call` schema was not consistently populated during earlier sessions. Session S12 appears to have introduced better logging (`mcp_call` entries), but Sessions S09.5–S11 lack corresponding tool event records.

Actual Tool Usage vs. Ledger:

Recorded in ledger: 3 `mcp_call` events

Inferred from findings: 50+ tool invocations (conservatively estimated from F-001–F-016 corpus analysis)

Discrepancy: ~94% of tool activity unlogged in ledger

3. Session Deliverables Repository

3.1 Artifact Inventory

Location: `E:\AAll XPlain\Dossier Space Pilot\Session GIT Deliverables\`

Artifact Count: 118 files

Managed By: Leonard (external assurance reviewer; GitHub integration)

Status: All findings (F-001 through F-016) filed

3.2 Recoverable Work Product

- ✓ Investigation findings (ROMER framework)
- ✓ Custody server configurations and tool definitions
- ✓ Governance ledger snapshot (this report)
- ✓ Keyword search inventories
- ✓ Candidate set documentation
- ✓ Cross-model assurance reviews (Mistral, Grok)

Conclusion: Session deliverables remain intact and traceable, despite ledger gaps.

4. Architectural Assessment

4.1 Sovereign Infrastructure Integrity

Status: ✓ **Sound**

The sovereignty argument (all evidence stays on-workstation, no cloud API integration) is architecturally intact. MCP Custody Server v1.4.3 is registered, all 7 tools verified operational, and the workstation-based analysis chain is unbroken.

4.2 Ledger Architecture

Status: ⚠ **Requires Rethink**

The current ledger schema captures some event types but lacks:

Consistent session lifecycle logging

Tool invocation tracking aligned with actual MCP tool calls

Memory compression / context window management events

Recommended Actions (for Session 13 prep):

Define which entry types **must** be logged for governance (recommend: all session boundaries + all tool calls)

Verify that the MCP Custody Server logs tool invocations to the ledger

Test ledger writing end-to-end in a controlled session

If ledger cannot be fixed retroactively, freeze current state and begin Session 13 with corrected schema

4.3 Self-Diagnosis Constraint

Status: ✓ **Maintained**

The ledger issue was identified and diagnosed without external technical escalation. No hand-editing of ledger entries was performed (Ken explicitly prohibited fabricating audit data). The finding stands as valid evidence of a gap, not as grounds to suppress or amend records.

5. Cross-Reference: Ledger vs. Deliverables

5.1 Sessions with Findings

Session	Ledger Closes	Findings Filed	Deliverables Count
---------	---------------	----------------	--------------------

S09.5	0	F-001 to F-004	✓ Filed
-------	---	----------------	---------

S10	0	(Support session)	✓ Filed
-----	---	-------------------	---------

S11-v1.4	0	(Infrastructure)	✓ Filed
----------	---	------------------	---------

S12	3	F-005 to F-016	✓ Filed
-----	---	----------------	---------

Verdict: Findings are independently recoverable from deliverables; ledger gaps do not invalidate findings.

6. Impact on Session 13

6.1 Prerequisites for Continuation

Before Session 13 proceeds, resolve:

Ledger architecture: Determine whether Session 13 will use corrected logging or freeze current ledger state

Tool call tracking: Establish mechanism to log all MCP Custody Server invocations

Session closure: Ensure Session 12 close events are recorded (currently 4 of 7 missing)

6.2 Investigation Continuity

Vince Kaminski / LJM-Raptor investigation (Stage 5 corroboration) is ready to resume

`buy-r` and `whalley-g` custodians identified and staged for Session 13 analysis

No findings or evidence are lost; all F-001–F-016 remain available

7. Recommendations for SCL Paper

Disclose the ledger gap clearly — transparency strengthens the governance narrative, not weakens it

Emphasize the findings-first approach — governance ledger serves oversight, but findings files are the system of record

Note the self-diagnosis success — the pilot identified and isolated the ledger issue internally, per design

Propose remediation for future cycles — ledger schema refinement before Session 13 is a governance best practice

8. Audit Sign-Off

Aspect	Status	Verified
Ledger integrity	⚠ Partial (gaps identified)	✓
Findings integrity	✓ Sound	✓
Deliverables integrity	✓ Sound (118 artifacts)	✓
Sovereignty constraint	✓ Maintained	✓
Self-diagnosis	✓ Successful	✓

Audit Date: 2026-08-24

Auditor: Claude (Design Lead)

Status: Ready for review and Session 13 prep

Next Step: File this report to Session GIT Deliverables; schedule Session 13 ledger architecture discussion with Ken and Leonard before proceeding to live corpus analysis.
